Farm'd: connecting local chefs and farmers

Farm'd is an online farmers market that connects buyers and sellers of local food and provides logistics for up to next day delivery. The goal was to create a platform where customers can find delicious food system for both farmers and chefs, who care about what food is brought into their kitchens. Farm'd is a two sided marketplace that helps farmers sell more of their produce with a higher return, while also sourcing and providing fresh food for their customers as quickly and cost effectively as possible.

Farm'd hired me to help take their MVP from barely usable to awesome. The core dashboard not only provides chefs a new way to source and purchase food, but also gives them the ability to compare and comparable marketplaces, but also gives the feedback and validation on their products that is sometimes lacking at a traditional farmers market.

RESEARCH

Using a design-thinking approach, I began by talking to stakeholders at Farm'd, testing the current-state web app, going out and doing user research, including interviews with internal stakeholders & farmers & chefs, and synthesizing all of those into artifacts like user flows, journey maps and User Stories. I completed all feedback I got into a system that would prioritize and organize, share each piece of feedback, track its resolution with the rest of the team.

FEEDBACK SYSTEM

I created an Airtable spreadsheet and linked each piece of feedback to the affected screens within the product, so I could quickly see what areas of the app had been looking to accumulate a lot of negative emotional state during. I also set up Airtable so that I could quickly assign everyone on the team had access to that would automatically populate into my personal dashboard. This allowed me to share one team prioritized feedback list, which I then linked to user testing huddles, so that we could collaboratively fix the low changes would be part of.

CUSTOMER JOURNEY MAP

After collecting all the feedback, I mapped out the customer journey from beginning to end that our users were going through. I created a goal we could all work towards, and a shared understanding of the office with all of the user feedback at each step in the process. Once I had mapped out the pain points, I could start to ideate on solutions to improve the changes being made to the product.

FARMER DAN

Motivated by increasing sales, getting their products out to new potential buyers, and Farm'd handling all aspects of the delivery process.

Needs: To receive feedback & validation from buyers on sold products and an easier way to navigate the Farm'd platform.

Pain Points: Lack of trust & information about unfamiliar buyers, and a confusing and time consuming customer process and difficult product management.

Opportunities: Improve the available options of product information so farmers can sell & empower them to be able to better sell their products online.

CHEF LOUISE

Motivated by potentially getting a better price & more availability on fresh food, gaining new relationships with those growing the food they buy, and being able to support local farming in Virginia.

Needs: Quick access to a range of fresh products for seasonal menu with flexible delivery options.

Pain Points: Difficulty using the marketplace to find products, lack of trust & information about unfamiliar farmers & information, and unclear charges & invoices in the Farm'd platform.

Opportunities: Improve how farmers and chefs communicate & connect and allow chefs to request the specific, unique products they are looking to buy.

NEW BRANDING

Farm'd's potential and not match what the stakeholders described to me as their brand identity. I started the redesign process with a mood board, which helped me to visualize the brand identity that we were trying to create. I then created a moodboard, which helped me to visualize the brand identity that we were trying to create. I then created a style guide that included colors that Farm'd already used, and a new consistent font that was easier to read across platforms. I also created a new logo that was more in line with the brand identity I was trying to create. I then created a style guide for a redesign version, so that I could see how it would look and implement all of the changes I was making more consistently.

MOODBOARD

NEW STYLE GUIDE

NEW NAVIGATION

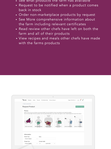
Difficult navigation was a pain point for both users. The navigation was at cramped into one dropdown stack in the middle of the nav bar that is hard to find and navigate between, and although the architecture was fine and was created new site maps. Another major pain point for both users was the fact that they had no access to edit almost any of their company or account information, which was alarming to both farmers and chefs. I redesign all of the settings pages and their placement with the following:

FARMERS: company information, profile information, pickup address, delivery dates, team members, stripe connection, and notification settings

CHEFS: company information, delivery address, payment methods, team members, and notification settings.

IDEATION & WIREFRAMES

Next I started sketching potential solutions for problems that were blocking users from completing the user flows. I created wireframes for the most important screens in the user flows and journey map. I tested out some of our users to get their instant feedback on the new ideas very early in the process.



TESTING & ITERATIONS

Cops are another part of our daily lives. The public needs a safe platform to be able to easily give feedback based on our experiences with police in their. We want to assist and train cops, but also be able to keep it as a tool that empowers officers and community. Just as police officers serve to protect us, we want a way to be able to protect the amazing officers of our community as well.

SOLUTION

I tested the rest of the wireframed solutions for each step in the customer journey as a team of Farm'd. Before, iterated on them, and finally brought the high fidelity designs to life. Below is the entire customer journey map, before & an overview of the redesigned Farm'd dashboard!

NEW ACCOUNT CREATION & ONBOARDING FLOW

SOLUTION

DISCOVER BUYERS

Before the redesign, Farmers would have to go through a 3 step hand process for each buyer before they farm would populate in the dashboard. This was frustrating for any consumer, especially about buyers, which we deeming farmers from connecting.

Now, the redesign, all buyers and sellers are automatically connected after creating an account. Farmers now have the option to edit any consumer if they wish. I also added automatic logic to populate on each buyers card with: distance, delivery days, minimum order, or have explained an interest in buying.

FARM PROFILE

On the new profile for farmers, chefs can now:

- See what products the farm has available
- Request to be notified when a product comes in season
- Order non-marketplace products by request
- See More comprehensive information about the farm, including photos and videos
- Read reviews other chefs have left on both the farm and all of their products
- See how many times other chefs have made with the farms products

PRODUCT MANAGEMENT

Farmers now have the option to add any product they want, either by searching through existing products, or creating a new one. Farmers can now control over the product name, description, product type, inventory level management, and product photos. Farmers can also add photographs to help empower them to add pictures that make their new products look more appealing over the internet than before the redesign.

INCENTIVES

Messages get a total refresh! Farmers can now send messages with discounts, specified quantities, and shipping to any chef they want for private viewing.

MARKETPLACE IMPROVEMENTS

Chefs can now modify a newly built catalog for marketplace to find products to buy. After visiting a farm's profile page, chefs can click on the "Shop" button. They land on the marketplace product details on mobile and desktop. I started to add additional features to the page, like the ability to sort/sort and scrolling to make to add using a revised the product cards so that they can see more product information. I also added a "Sort by" dropdown menu to help chefs find the specifics to highlight products that the user has saved for previously, and products similar to those that they've ordered, and products they've added products as their favorite.

CHECKOUT

Now that chefs can view the marketplace and find products, next was improving the checkout experience. I added a 'checkout & pay' button right into the cart for chefs to easily see what they're ordering, and be taking the 4 step process down to 2 steps.

ORDER CONFIRMATION

Farmers will now receive an automatic message notification from the chef about the order placed, and farmers will be able to review and confirm the order and download the pick list.

Before the redesign, the Farm'd dashboard was set up in a way where farmers would be looking at all incoming orders to approve on one screen. The less information that was on the screen, the more time it took when number of different orders being managed at one, but there were are a lot of buttons that tasked farmers with clicking. Farmers also found that they would frequently call Farm'd customer support to fix orders due to mistakes on the screen.

Now farmers will simply view one order at a time to confirm or edit it. They also now have the option to add a message back to the buyer, to make the whole experience more conversational and personal.

REVIEW ORDERS

Before the redesign, users had one screen to review all product orders that they would from all at once. It was confusing and intimidating for most buyers, which resulted in exactly 0 orders being confirmed. The redesign now breaks down the ordering & suggested pick order view for the product cards would disappear as soon as you chose a star rating, which ended up happening for 100% of the time during user testing sessions and it's answer multiple.

After the redesign, I reorganized the site architecture so that it's all inclusive 'review produced' page, buyers now have the option to review all products at once, or review them one by one screen. The dashboard will automatic answer in real time. So now the cards stay in place so users don't feel pressured or rushed.

SHARING SUCCESS

Chefs now have the option to send farmers recipes and pictures of the meal they made with the products they bought. Both users found this very exciting and fun to share with each other! Farmers also found that they loved getting the feedback & validation they had been missing since they left the farmers market. Chefs now have the option to keep it private or share it on the live page of their profile with the products it's tagged, for other chefs to see.

IMPLEMENTATION

Now the redesign was the fun part, I broke it up into manageable sections in the dashboard to be built in two week sprints each. I created a timeline for the next few months and hung it on the office so everyone on the team knew which parts of the dashboard were being worked on and when. Before the redesign, Farm'd was using a Ruby on Rails framework, which was a technical limitations I wasn't aware of, and work together to find new solutions when issues were. After the meeting, I broke down each sprint into tasks and estimated working days for each. I also created a Trello board to keep track of the tasks that I was working on and what was completed and what was left to do. I worked with the developers to implement the changes. I then had approval before pushing to production. I made 2 product release blog for the team outlining all upcoming changes in the product or everyone would be prepared to educate our users. After each update was released, I used Fullstory to watch our users use the new interface & measure for success.

RESULTS

Prior to the redesign, farmers had not received any reviews yet. Upon testing the new designs - they were excited to see a dashboard that was easier to navigate, and more visually appealing. They also loved the ability to see all of their orders on one page. Users intuitively knew exactly where to go the next time to find new, incoming reviews.

Chefs now have the option to send farmers recipes and pictures of the meal they made with the products they bought. Both users found this very exciting and fun to share with each other! Farmers also found that they loved getting the feedback & validation they had been missing since they left the farmers market. Chefs now have the option to keep it private or share it on the live page of their profile with the products it's tagged, for other chefs to see.

NEXT STEPS

- I'd like to give farmers some stats so they can see which products are selling well and who their best buyers are
- Add ability for farms to connect with farms and buyers connect with other buyer - to make it more community based
- Add ability for farmers to communicate with buyers about upcoming harvests
- Add ability for farmers to request products from other farmers
- Allow farmers to upload products with multiple sale variations and prices
- Create a subscription model for farmers, so that they can continue to grow, how much, and when to optimize sales
- Add ability for farmers to create and upload videos of their farms to the dashboard
- Update managing products & orders on mobile for farmers
